FICHET-BAUCHE

GC68 BANKERS QUALITY SAFES

WALLS

All the walls of these safes have a total thickness of 153 mm (6") and are formed of a complex material called "Complexe GC", which adds Volcanite-two to the traditional and well-proven protection of Fichet-Bauche safes in an overlapping structure which increases the difficulties confronting the burglar.

DOOR

The door has a total thickness of 216 mm (8 1/2"), giving an actual protective thickness of 153 mm (6"), which is further reinforced in comparison with the walls, particularly in front of the locking and combination mechanisms.

It is mounted on external pivots, which enable it to be opened through 180°.

LOCKING

The principal locking mechanism is an "NS" pump lock. This high security lock is operated by a short key. It is linked to our "Monocommande" combination lock, which offers a total of 63 million real and different possible combinations, thus ensuring that the secret of the lock is kept. These two mechanisms are protected by the whole of the door's defences.

The three largest models can also be fitted with a time lock with three chronometers, which allows the safe door to be immobilised for a period determined by the user.
